

NOMOS GLASHÜTTE NEOMATIK COLLECTION MIDNIGHT BLUE

After years in research and development, Nomos Glashütte's DUW 3001 calibre has debuted in a collection of slender automatic timepieces, which boast chronometer-level accuracy—and now midnight-blue dials too.

Nomos Glashütte's latest mechanical calibre, DUW 3001, is the hallmark of its Neomatik series—a collection of slender automatic timepieces that launched with a first edition in the autumn of 2015. This initial collection of ten limited edition models has since gone into series, and now comprises of fifteen watch models with white silver-plated, champagne-coloured or—brand new—midnight blue dials.

The watchmaking company's tenth proprietary calibre is revolutionary in that it is only 3.2 millimeters in height. Therefore, it gives the models of the Neomatik series a particularly slender form and, at the same time, makes them capable of achieving chronometer-level accuracy. This combination of attributes was previously unheard of within Nomos Glashütte's price segment.

The latest additions to the Neomatik collection are Metro Neomatik, Tangente Neomatik, and Minimatik—all available in "nachtblau," an exquisite shade of midnight blue. Blue is the colour of infinity, of the sky and of the sea, creating timepieces perfect for podiums, premieres, and parties. The elegant exterior of these new watches thus perfectly matches their refined interior—which houses the automatic calibre DUW 3001.

The new midnight blue watches of the neomatik series: from left to right, Metro, Tangente, and Minimatik.

Thinner than a stack of nine stamps: Introducing DUW 3001, the tenth and latest automatic calibre from Nomos Glashütte. Despite entirely new dimensions, the elegant movement is extremely accurate. In comparison to traditional calibres, its production tolerances have been reduced by up to fifty percent.
