THE LONGINES MASTER COLLECTION

NEW SELF-WINDING MOVEMENT WITH MOON PHASE

Longines reaffirms its watchmaking expertise with the addition of new creations that strengthen one of its flagship lines, The Longines Master Collection. Powered by a new self-winding movement developed exclusively for Longines, these timekeepers are characterised by a moon phase indicator and a refined aesthetic, creating a balance between technical excellence and classic elegance.

Longines is introducing new models to its mechanical line The Longines Master Collection, launched in 2005. The latest versions feature a moon phase indicator at 6 o'clock circled by an Arabic numeral date ring on which a hand points to the current day. The mechanism is powered by a new movement developed exclusively for the brand – the L899 calibre.

Available in two sizes (40 and 42 mm in diameter), the new models of The Longines Master Collection come with a range of different dials: black barleycorn with painted Roman numerals, silvered barleycorn with painted Arabic numerals or blue sunray with applied indexes.

The 40 mm variant is also available in a version with diamond indexes for a refined result. The new models of The Longines Master Collection are fitted with either a stainless steel bracelet or a black, brown or blue strap to match the different dial colours.

The 40 mm stainless steel case of this model from The Longines Master Collection contains a new movement developed exclusively for Longines – the L899 calibre. It features a moon phase indicator at 6 o'clock circled by an Arabic numeral date ring on which a hand points to the current day. Its blue sunray dial is adorned with diamond indices. A blue leather strap completes this timepiece.
